

Itherm has the ability to change the position of water molecules at 434 Millions times per seconds, the motion creates shocks between the molecules, and creates a heat.

Itherm as the water molecules are 1.2 Million times smaller than cells, the Itherm send a strong and directed electrical field, through the cell membrane in order to reorganisate it.

Itherm the Itherm use a specific ultra low frequency modulation between 0.4 Hertz to 2 Hertz close to the heart rate which the smooth muscle on peripheric veins and vessels are sensitive, similar to sympathetic and parasympathetic action sensitive. As it's not possible to induce a low frequency by non invasive method , the Itherm use the microwave frequency as the carrier of ultra low frequency, and bring it to the deep tissues and where we need it.
